Maternal Health Risk Assessment Report

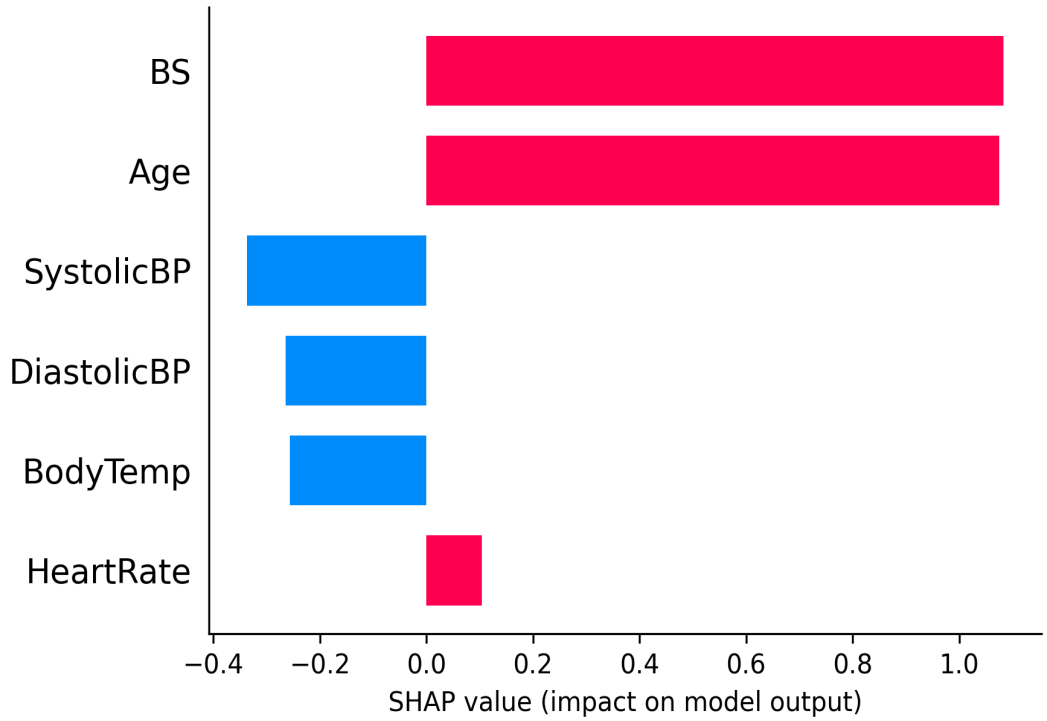

Patient Information

Name	XYZ
Age (years)	40.0
SystolicBP (mmHg)	120.0
DiastolicBP (mmHg)	95.0
BloodSugar (mmol/g)	11.0
BodyTemperature (F)	98.0
HeartRate (bpm)	80.0

Model Prediction

Predicted Risk Category: **HIGH**
Prediction Confidence: 0.6650000214576721

Model Explainability (SHAP)

The SHAP bar plot above illustrates the relative contribution of each clinical feature to the model's risk prediction for this patient.

Risk Summary

The patient is classified as high-risk based on current clinical parameters.

The following are expected to contribute to the risk: ['BS', 'Age', 'BodyTemp']

• BS has a value 11.0 indicating Severe hyperglycemia
• BodyTemp has a value 98.0 indicating Normal

Clinical Observations

• BS is currently 11.0 (Severe hyperglycemia). Reducing it to approximately 9.89 would move it into the Moderate hyperglycemia range, which may lower maternal risk.

Lifestyle Recommendations

• Adopt small, frequent meals with low glycemic index foods, limit refined sugars, and monitor blood glucose regularly.

Medical Guidance

• All medications should be taken strictly under medical supervision, especially during pregnancy.
• BS indicates Severe hyperglycemia. Prompt clinical assessment and potential medical intervention may be necessary.
• Immediate medical evaluation is recommended. Hospital-based monitoring may be required.

Conclusion & Disclaimer

The model indicates a high maternal health risk.It is advised that immediate medical attention be given.

This report is generated using a machine learning model and is intended to support, not replace, clinical judgment.
